

Safe Electrical Connection

Using **suitable and protected electrical cables, switches and plugs** can prevent electrical sparks and hence **Prevent Fire**.

Always:

- Use I.S.I. certified appliances.
- Use one socket for one appliance.
- Check power cords and plugs daily. Replace broken plugs and switches.
- Switch off the electric supply of the fire affected areas.
- Keep the electrical wires away from hot and wet surface.
- Switch off appliance after use and remove the plug from the socket.
- Have any cord that feels more than comfortably warm, checked by an electrician

Never:

- Never break off the third prong of a plug
- Never use extension codes as permanent wiring.
- Never have temporary or naked joints on wiring.
- Never lay wires under carpets, mats or doorways. They get crushed, resulting in short circuiting.
